

Doofenshmirtz Evil Incorporated

Password and Access Policy — Version 2.0

1. Purpose

Version 2.0 lengthens passwords and adds multi-factor login, after a penetration test revealed that the master inator console's password was 'doof123'.

2. Scope

This policy applies to every account on every company system, including the inator control panels and the Norm-bot maintenance terminal.

3. Password Rules

3.1 Length. Passwords must now be at least 12 characters long, up from 8 characters. Passphrases made of four random words are encouraged.

3.2 Rotation. Passwords must be changed every 90 days, and may not reuse any of the previous five passwords.

3.3 Banned Passwords. The banned list adds 'doof123', 'gimmelshtump', and any password containing the CEO's birthday.

4. Badge Access

4.1 Badge Display. Employee badges must be visible at all times inside the building. Badges worn on a fedora do not count as visible.

4.2 Tailgating. Employees may not hold secure doors open for anyone, including adorable teal animals who appear to be lost.

5. Lost Devices

Lost laptops and phones must be reported to IT Security within 24 hours. Devices lost inside an inator's blast radius must be reported immediately.

6. Multi-Factor Authentication

6.1 Requirement. Multi-factor authentication is required for email, the inator control panels, and the payroll system.

6.2 Approved Second Factors. Approved second factors are an authenticator app or a hardware key. Answering a riddle posed by Norm is not an approved second factor.

7. Acknowledgment

Logging in to any company system constitutes acknowledgment of this policy and a promise not to write your password on a sticky note shaped like a platypus.
